Case Study: A Sensitivity Label Preventing Data Exposure

A well configured sensitivity label at Meridian Trust Bank stopped a potential data exposure before it happened.

1 The Attempt

The Attempt

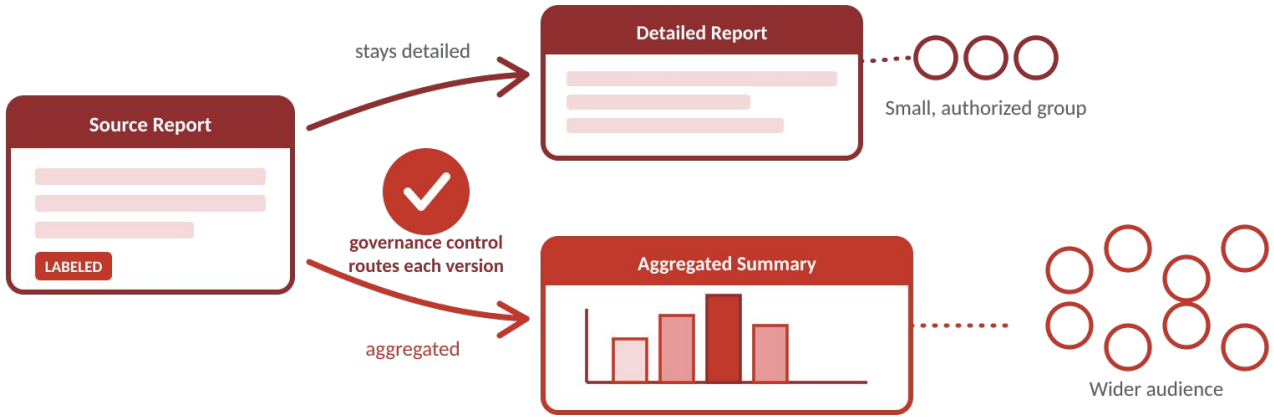

An analyst tried to share a dashboard containing account-level detail with a broader distribution list than intended. The sensitivity label on the report blocked the attempt automatically.

2 The Correction

The Correction

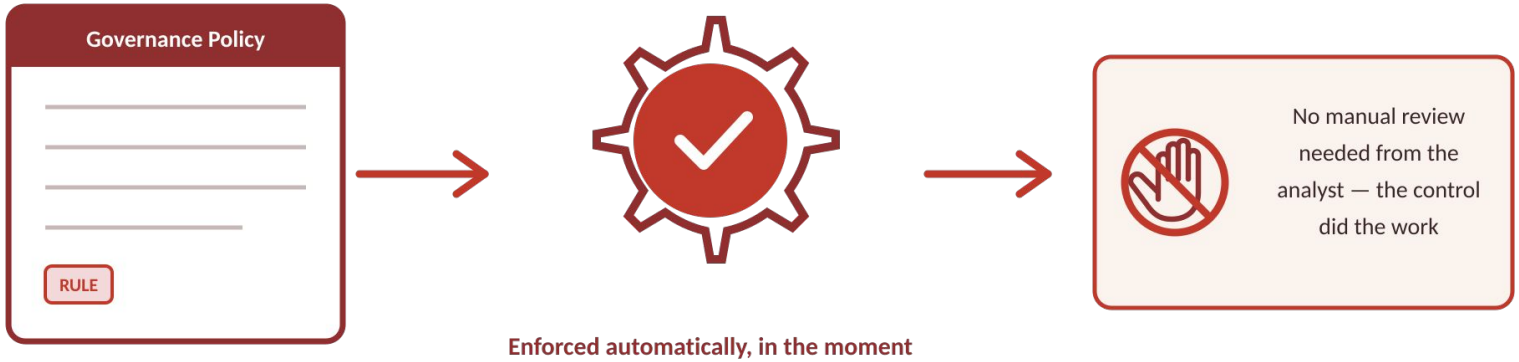

The analyst instead shared an aggregated version of the dashboard appropriate for the wider audience, preserving the detailed version for the smaller, authorized group. The governance control did the enforcement work the analyst did not have to do manually.

3 The Lesson

The Lesson

Governance controls like sensitivity labels do not just document policy, they actively prevent mistakes in the moment. This is exactly why applying them from the start, as covered earlier, matters so much.

THE LESSON

The control caught the mistake before a person had to.

A sensitivity label configured ahead of time meant the wrong share never went out, and the right version reached the right audience automatically.
