Case Study: Connecting Meridian Trust Bank's Alert Data

An analyst building the bank's first SOC operations dashboard needed to combine two different data sources.

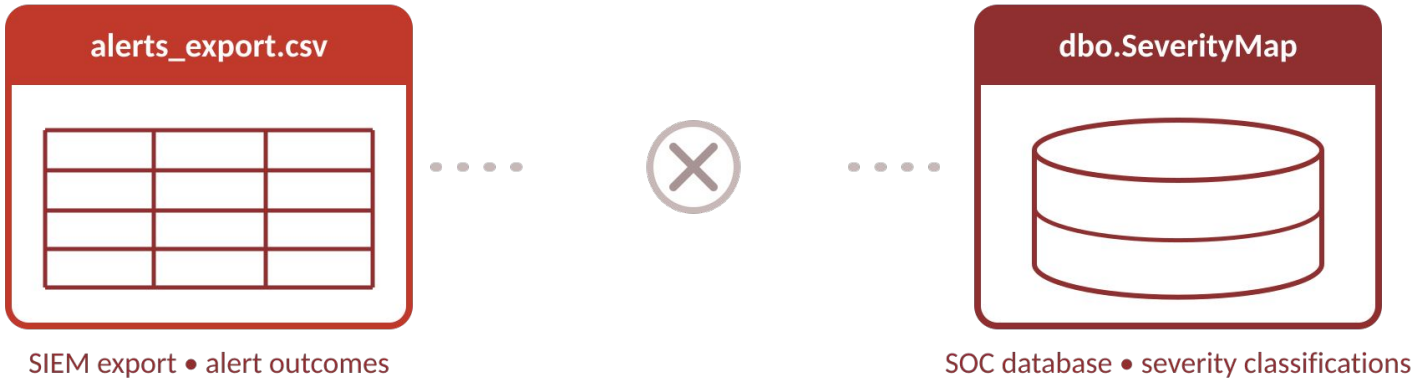

Dominic Yeakel | 9/30/2026

1 The Sources

The Sources

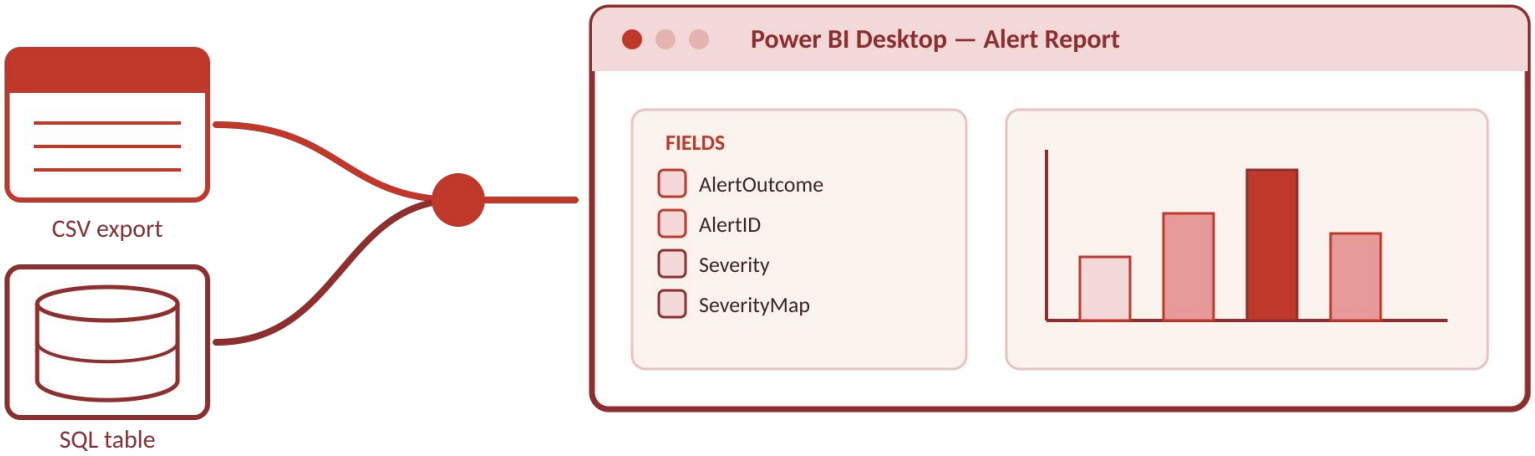

Alert outcome data lived in a CSV export from the SIEM, while severity classifications lived in a separate SQL table maintained by the SOC. Two systems, two owners, two formats. Neither one told the full story on its own.

2 The Connection

The Connection

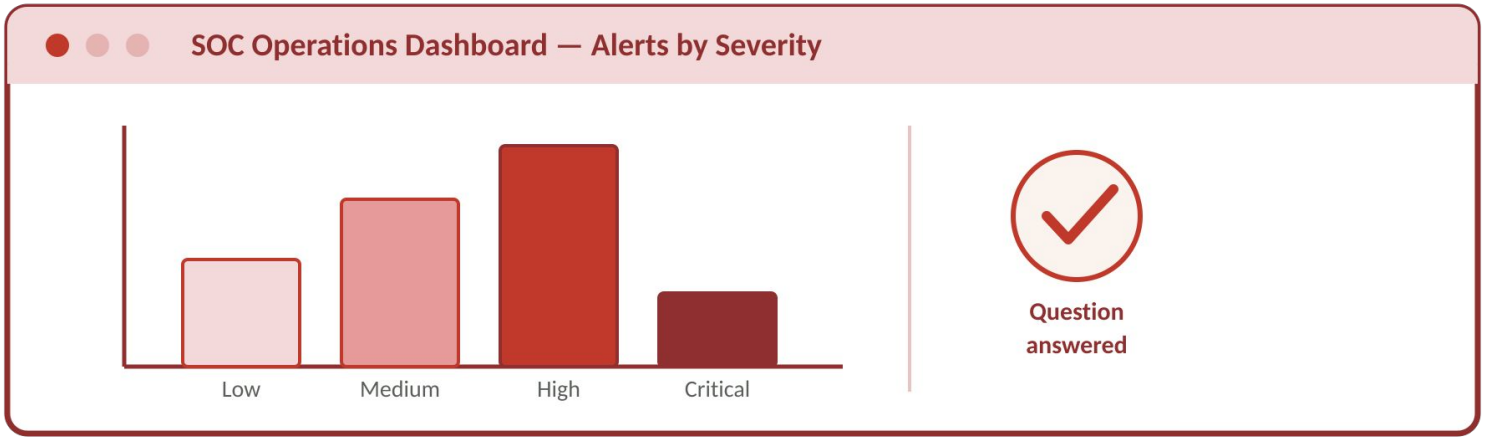

The analyst connected both sources directly in Power BI Desktop, bringing them into the same report for the first time. Once the right sources were identified, the technical work itself was almost trivial.

3 The Result

The Result

With both sources connected, the dashboard could finally show alerts broken down by severity.

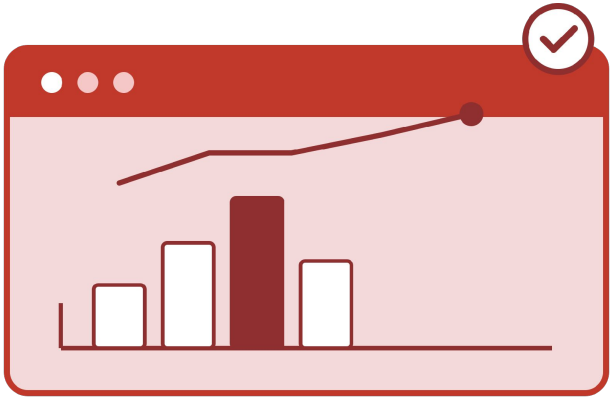

THE LESSON

The hardest part isn't the connection. It's knowing which sources to connect.

Case Study: A Finished SOC Operations Dashboard

The finished version of Meridian Trust Bank's SOC Operations dashboard now serves the team daily.

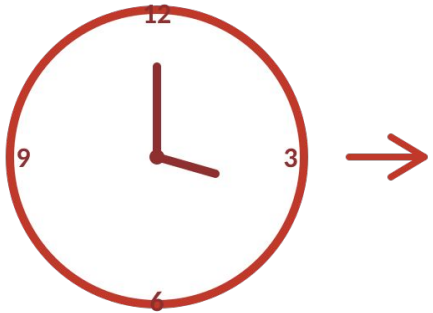

Dominic Yeakel | 9/30/2026

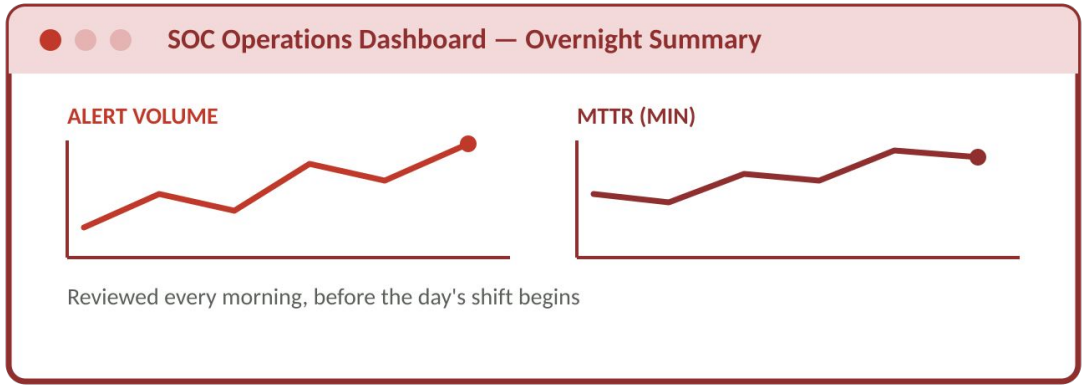

1 Daily Use

Daily Use

SOC leadership reviews the dashboard each morning to check overnight alert volume and MTTR trends before the day's shift begins. This daily habit came directly from the questions identified during last week's exploration.

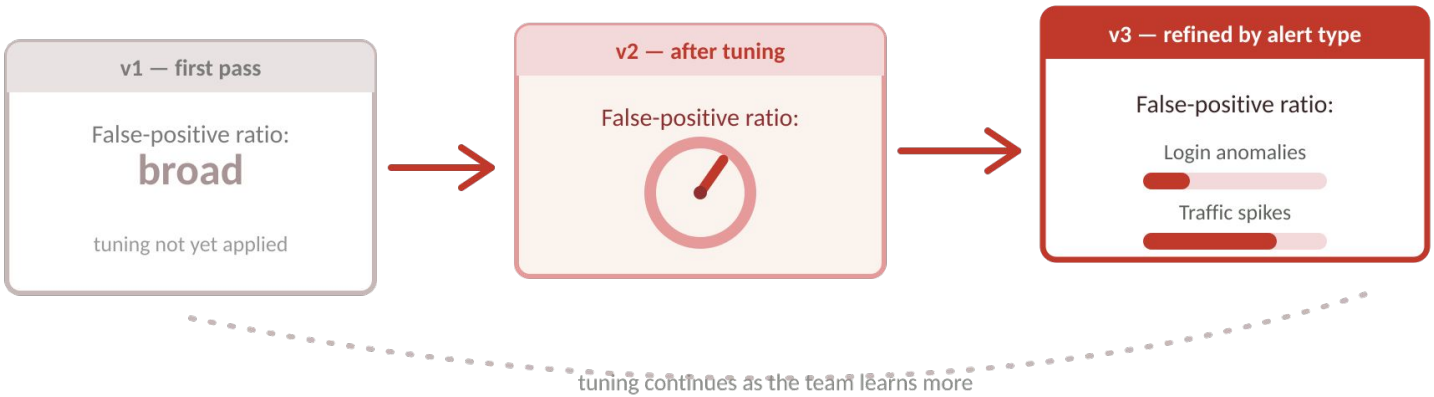

Before shift start

2 Ongoing Refinement

Ongoing Refinement

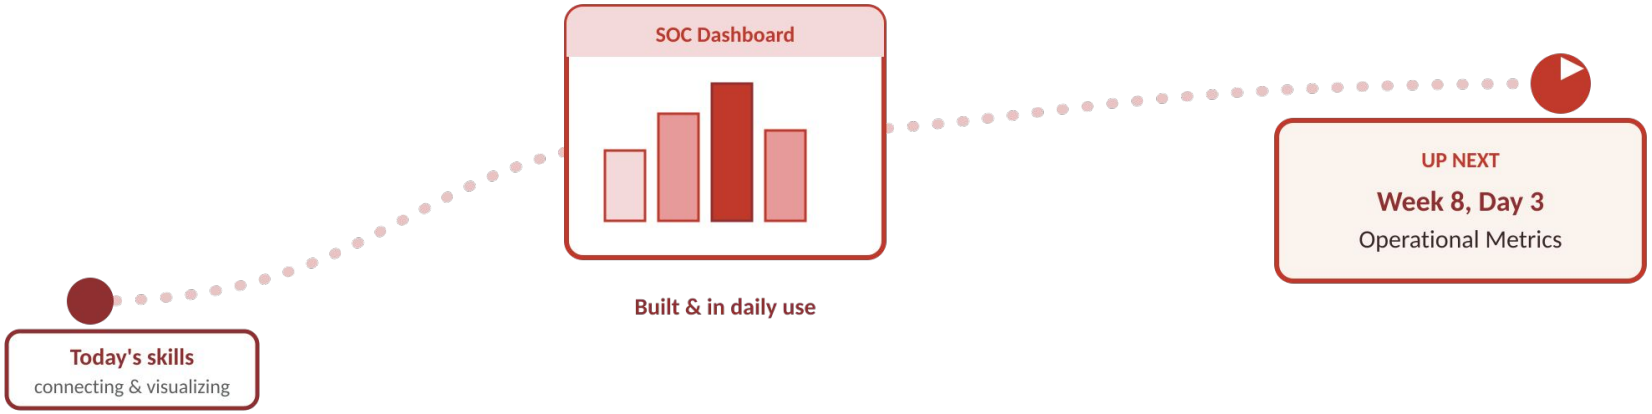

The false-positive ratio measure has since been refined further as the team learned more about which alert types needed tuning. A first dashboard is rarely the final version, and that is expected.

3 The Bigger Picture

The Bigger Picture

This dashboard, built using exactly the skills covered today, now supports the operational metrics conversation covered in Week 8, Day 3 on an ongoing basis.

THE LESSON

A dashboard isn't a deliverable. It's a habit you build into the team's day.
